

HACKATHON INDIA

Complete App Documentation

Generated August 2026

1. WHAT THE APP IS

Hackathon India is a web app that helps people discover hackathons across all Indian states, plus online hackathons. It lists events gathered from Devpost, Unstop, HackerEarth, major tech news sites and state-wise Google News. For each event it shows dates, registration deadline, mode (online/offline), prize pool and a link to the official website. Users can search, filter by state, save favourites, and submit their own hackathon for review.

2. MAIN FEATURES

- Lists 116+ hackathons, refreshed automatically every day at 9:00 AM India time
- Search box with Google-style suggestions
- Filter chips: ALL INDIA, FAVOURITES, GOVERNMENT, each state, ONLINE, UPCOMING
- Detail view: description, dates, deadline countdown, prize pool, website link
- Favourites saved on the device (localStorage)
- Submit a hackathon via the Post form (goes to pending review)
- Status badges: ONLINE, UPCOMING, LIVE, ENDED and a GOVT badge for government events
- NEW badge + 'Last refresh' line so visitors can see the list is updated daily
- Installable as an app (PWA) with a custom India-map icon
- Works offline: shows the last loaded list with an OFFLINE chip

3. HOW IT WORKS (DATA FLOW)

1. index.html loads the hackathon list LIVE from Supabase through a REST API
2. A GitHub Actions workflow runs every day at 9:00 AM India (3:30 AM UTC)
3. The finder script scans many sources and inserts newly found hackathons
4. The site picks up the new rows automatically - no rebuild or manual upload needed

4. GITHUB REPO

Repo URL: <https://github.com/nithishkumar2703/hackthon-india>

Default branch: main

Live site: <https://nithishkumar2703.github.io/hackthon-india/> (GitHub Pages)

Main contents: index.html (the app), auto_finder/fetch_hackathons.py (daily finder),

database/setup.sql + add_real_hackathons.sql (schema + seed data),

assets/ (logo, icons), sw.js + manifest.webmanifest (PWA),

.github/workflows/daily_finder.yml (daily trigger),

AGENTS.md, SECURITY_SCAN_REPORT.md, NEXT_STEPS.md,

plus a Flutter app skeleton (lib/, pubspec.yaml) for a future native app

5. SUPABASE

Project URL: <https://ciarlvcyhieieioxyth.supabase.co> (PostgreSQL, free tier)

Tables: hackathons (main list) | states | organizers | submissions (user posts)

hackathons columns: id, title, tagline, description, state_id, city, venue,

mode (online/offline/hybrid), start_date, end_date, deadline, thumbnail_url,

website_url, organizer_id, prize_pool, max_team_size, is_active, created_at

Data: 115 hackathons seeded from SQL + new ones added daily (currently 116+)

Frontend uses the PUBLISHABLE key - it is designed to be public and safe

The SECRET (service role) key exists ONLY as a GitHub Actions secret,

never committed to the repository

6. UPDATE SCHEDULE

Frequency: once per day

Time: 9:00 AM India Standard Time (3:30 AM UTC)

Trigger: GitHub Actions workflow named 'Daily Hackathon Finder'

Cron expression: 30 3 * * * (UTC)

It can also be triggered manually from Actions -> Daily Hackathon Finder -> Run workflow

Note: GitHub pauses scheduled runs if a repo stays inactive for 60 days

7. ONLINE / OFFLINE BEHAVIOUR

ONLINE: the app always shows the freshest data (network-first fetching)

OFFLINE: it shows the last loaded list from the device cache, marked with a red OFFLINE chip next to the last refresh time

The app shell (page, styles, icons) is cached by the service worker (sw.js), so the app OPENS without internet - only data refresh needs a connection

8. TECH STACK

Frontend: single-file HTML/CSS/JavaScript (vanilla, no build step, no install)

Icons: Font Awesome (CDN)

Backend: Supabase (PostgreSQL) accessed via REST API

Automation: Python script auto_finder/fetch_hackathons.py on GitHub Actions

PWA: manifest.webmanifest + service worker sw.js (installable, offline cache)

Future: Flutter app skeleton in the repo (lib/, pubspec.yaml)

9. SOURCES SCANNED BY THE DAILY FINDER

Devpost, Unstop, HackerEarth, Hacker News, YourStory, Inc42, TechCrunch, TOI Tech, The Hindu Tech, IndianExpress Tech, Moneycontrol Tech, HackerNoon, and Google News for each Indian state.

10. SECURITY NOTES

The publishable key in the frontend is public by design and safe

The secret (service role) key is stored only in GitHub Secrets

One finding: the submissions table was publicly readable (emails exposed).

Fix (run once in Supabase SQL Editor):

drop policy "public read submissions" on submissions;

Full details are in SECURITY_SCAN_REPORT.md

11. KEY LINKS

App: <https://nithishkumar2703.github.io/hackthon-india/>

GitHub: <https://github.com/nithishkumar2703/hackthon-india>

Actions: <https://github.com/nithishkumar2703/hackthon-india/actions>

Supabase: <https://supabase.com/dashboard/project/ciarlvcyhieieioxyth>

12. LOCAL PROJECT

Folder: C:\Users\DELL\Desktop\hackthon search\hackathon_india

Main file: index.html - can be opened directly in a browser to run the app offline from the PC.
